

Chapter 3: Type

By: Carlos Zamora

Data 110 - Fall 2026

What Is Typography and Why Does It Matter?

- Typography is the way text is designed and presented, including typeface (fonts), size, spacing, and style.
- Text design affects how the audience takes in information, and how the audience's eyes move around your presentation
- Typography should be used throughout presentations to improve communication with the audience, and not just to make your presentation look nicer

Make Your Text Bigger

- Less text, more focus on key points
- Larger text allows for clearer view from any distance
- Design presentations for people in the back of the room.
- 28 pt is a good minimum rule of thumb

Understanding Typefaces

- The term “typefaces” is used interchangeably with the word “font”
- 3 general typefaces:
 - Serif - has “feet” at the end of the letters - T
 - Sans Serif - No “feet”; thicker letter forms and generally easier to read - T
 - Script - curly letterforms; drop below the baseline of which Serif and Sans Serif letters usually sit - *T*
- Which is usually preferred for presentations?
 - Sans serif, as letters are thicker, basic, and easy to read

Font Families and Hierarchy

- Recommended to use 1-2 fonts, and 2-3 max only when there is a reason to
- Hierarchy
 - Size - bigger sizes allow for easier reading
 - Weight- Thickness of the letters(light, regular, bold)
 - Font choice - legibility
- All 3 come together to form a unified and consistent presentation using text

Bad Example

What is data Science?

Data science is an interdisciplinary field at the intersection of mathematics and statistics, computer science, and domain expertise. The integration of advanced analytics, artificial intelligence (AI), and machine learning with specific subject matter expertise is used to reveal actionable insights concealed within an organization's data – guiding decision-making and strategic planning. The data science life cycle is used to provide a solution, finding, or product in response to a problem or hypothesis. It aims to establish a standardized and repeatable framework for converting raw data into actionable business insights.

The term “data scientist” was coined when companies first realized the need for data professionals skilled in organizing and analyzing massive amounts of data. Ten years after the widespread business adoption of the internet, Hal R. Varian, Google's chief economist, the first dean of the UC Berkeley School of Information (I School), and UC Berkeley emeritus professor of information sciences, business, and economics, predicted the importance of adapting to technology's influence and reconfiguration of different industries. Data scientists turn raw data into real-world value.

They examine, clean, and structure complex data to assist organizations in making improved decisions and forecasting future trends. In doing so, they employ programming languages such as Python and R, along with SQL, machine learning, and statistical methods to transform source data into actionable insights. Data scientists examine which questions need answering and where to find the related data. They have business acumen and analytical skills as well as the ability to mine, clean, and present data. Businesses use data scientists to source, manage, and analyze large amounts of unstructured data.

Data scientists also leverage machine learning techniques to model information and interpret results effectively, a skill that differentiates them from data analysts. Results are then synthesized and communicated to key stakeholders to drive strategic decision-making in the organization. Skills needed: Programming skills (SAS, R, Python), statistical and mathematical skills, storytelling and data visualization, Apache Hadoop, SQL, machine learning

Good Example

What is Data Science?

- Combines math, statistics, and computer science
- Uses data to find useful information
- Helps with decision-making
- Uses AI and machine learning to analyze data

VUF

- **Visualize**
 - Audience is immediately influenced by text
- **Unify**
 - Be consistent with fonts; 1-2 for presentation
- **Focus**
 - Utilize larger text for audience to read and pay attention to you quickly; 28 pt text size is a good rule depending on font

Thank you!
